

## USING AI? CHECK THE PROMPT FIRST

# Don't type that: 10 things that count as student PII

### 1 A student's name

First, last, nickname — or initials plus details

### 2 Student ID or login

Any number or account tied to one child

### 3 Grades or scores tied to a child

"Score this" is fine; "score Maya's essay" is not

### 4 IEP, 504, or disability status

Among the most protected data in your building

### 5 Medical or medication details

Diagnoses, allergies, counseling, hospital stays

### 6 Behavior incidents with detail

Discipline stories can identify a child fast

### 7 Family or home circumstances

Custody, housing, income, immigration status

### 8 Contact info or address

Theirs or their family's

### 9 Photos or student work with names

An image can carry PII as easily as text

### 10 A one-of-a-kind combination

"The only 6th grader who..." — unique details identify

## Describe the need, not the child.

"A 7th grader reading two levels below grade" gets the same help — and identifies no one.

## THE ONE-MINUTE VERSION FOR THE BACK OF THE POSTER

# Why this list, and what to type instead

Public AI chatbots have no data agreement with your district, so student details belong in your gradebook, never in the prompt. The good news: the safe version works just as well — the AI never needed to know *who*, only *what kind of help*.

## The three moves

- **1 · Strip identity.** No names, initials, IDs, photos, or one-of-a-kind details.
- **2 · Generalize.** "A 4th grader" · "several students" · "a parent" · "my third period."
- **3 · Describe the need, not the child.** The reading level, the behavior pattern, the format you want back — that's all the AI ever needed.

## Instead of typing that... type this

| Risky prompt                                                      | Safe prompt (works just as well)                                                                                                       |
|-------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| "Write a comment for Maya Chen, who got a 61% and has ADHD."      | "Write an encouraging progress comment for a student scoring in the low 60s who struggles with sustained focus."                       |
| "Email Jayden's mom about him pushing another student at recess." | "Draft a factual, non-judgmental note to a parent about a physical incident at recess, with a partnership tone and a clear next step." |
| "Simplify this reading for my student with an IEP, Marcus."       | "Rewrite this passage at a 3rd grade reading level, keeping the key vocabulary."                                                       |
| "Make a seating chart: Ava can't sit near Liam because..."        | Keep seating charts out of AI entirely — that's judgment about specific kids. It was never a formatting problem.                       |

### BEFORE YOU PRESS ENTER

Could anyone who knows your school tell which child this is?  
If yes — strip, generalize, describe the need.

Names go back in **after** the draft comes back — into your own email, never into the tool.

**Train the whole staff in one session:** our complete AI Foundations & Safety PD — script, editable slides, and practice labs on exactly this skill — is in our TpT store.
