

3

TRACK A · AI FOUNDATIONS · KIT 3

Build Your First Classroom Tool

Word-for-Word Facilitator Script: read it aloud, or make it your own. Keyed to all 34 slides, with stage directions, a running clock, and the recovery line for every predictable break.

Facilitator Script · 45–60 minutes

Built by Adam & Katelyn Spinozzi

A husband-and-wife team of certified educators with over 20 combined years in the classroom. Adam is a certified CTE Carpentry teacher; Katelyn is a certified K-8 teacher.

How to use this script

Everything in plain type is meant to be spoken aloud. Read it verbatim (it's written for the ear) or glance and paraphrase once you're comfortable. Either way delivers a complete session. This kit assumes Kits 1 and 2: the one hard rule on student data and the four-part prompt formula are both in force here and get reused, not retaught. This session is hands-on from the middle onward, so read the lab support slides (22-28) before you present; they carry most of the troubleshooting weight so you don't have to improvise it live.

Meet Ms. Rivera. Throughout the deck you'll see the same example teacher's screen: Ms. Rivera, our running composite (not a real person; she appears in every kit). Today she builds one review game, start to finish, before the room tries it themselves. When her screen is up, point the room at it; it's the model to mimic. Her tracker chip sits top-right on every slide; the matching line under each slide cue below tells you what it says, so you always know what the room is reading.

Timing checkpoints

Clock	You should be...	If behind...
0:04	Starting the one hard rule (slide 5)	Trim slide 3's framing to one line
0:08	Starting the live loop demo (slide 9)	Skip slide 7's honest-limits detail; the loop demo teaches it anyway
0:18	Starting guided practice (slide 18)	Cut the vague-prompt demo (slide 15) to one sentence instead of a live run
0:24	Opening the lab (slide 21)	Open it anyway; the lab is the session
0:54	On what-you-built (slide 29)	Skip straight to the commitment slide (32) and hand out exit tickets

45-minute version: run the loop demo (slides 9-13) at two steps instead of four (describe+build combined, test+change combined), skip the live vague-prompt demo (slide 15, tell it instead of showing it), and take the lab down to 28 minutes. The lab loses at most two minutes; discussion is what gets cut. Read the "45-min cut" stage notes where they appear. A 90-minute version adds 25 minutes to the lab (55 total) and closes with a 5-minute share-out where three people project what they built; add that time at slide 21 and slide 31.

From the founders

→ *This note is from Adam and Katelyn Spinozzi, the two certified teachers who wrote this kit. It's here to give you their perspective before you present. Sharing it is entirely your call: read parts aloud where they fit, retell them in your own words, or keep it to yourself as background. The session is complete either way.*

We're Adam and Katelyn, and here is why this session matters for what happens in your classrooms: every other kit in this series teaches teachers to use a tool someone else built. This one teaches them to build the tool. That is a different kind of confidence, and it is the one that sticks. A teacher who has watched a blank file become a working game they can hand to their own students stops seeing "AI can write code" as a headline about someone else's job and starts seeing it as something they did, once, with their own hands, on their own laptop.

The lessons we believe this hour will leave with your staff: the loop that makes any of this safe to attempt, describe, build, test, change one thing, which works whether the tool is a review game or the next thing your building needs; the honest limit that the tool can still misunderstand a vague request with total confidence, which is why you always test before you trust; and the recovery habit, saving a copy before a risky change, that turns every possible mistake in this lab into a thirty-second reset instead of a lost afternoon. Nobody in this room needs to become a programmer. They need to leave believing they already have the one skill that matters here: knowing how to describe, in plain language, exactly what they want.

Segment 1 • Welcome & why now (slides 1-4)

SLIDE 1 Title

0:00

→ *Slide 1 up as people arrive. Start on time.*

Welcome back. In our last two sessions you learned the one hard rule for student data and a formula for writing prompts that actually work. Today is different from both: today you don't just use AI, you describe a small piece of software into existence, and you leave holding it. By the end of this hour, everyone in this room has a working review game, on their own device, for their own subject.

SLIDE 2 This is not optional anymore

0:01

MS. RIVERA'S SCREEN • SO FAR Her mandate: the state just funded this hour. Her building goes first.

Here's why this session exists this year specifically. Maryland just passed Senate Bill 720, now law, setting up statewide AI training for teachers, with the law's own intent of training educators by July 1st, 2027. It also requires every district to name an AI coordinator and publish a rubric for evaluating AI tools before buying them. Virginia and Ohio both passed their own 2026 laws the same year. And this isn't three states acting alone: the tracker FutureEd keeps counted 77 AI-in-education bills in 27 states during the 2026 session. That is a direction, not an outlier.

If asked "does our state have a law like this?" Say what you know and don't guess at the rest: "I don't know our state's specific timeline, but the direction is the same everywhere, more states are requiring this, not fewer. Today gets us ahead of it either way."

SLIDE 3 The money is already district money
0:02

MS. RIVERA'S SCREEN · SO FAR Her math: one purchase, the whole staff, half price after the first seat.

One more thing worth knowing before we start: Maryland's law is explicit that teachers must be compensated for this training, with time, money, or recertification credits, and may not be charged to attend. If your district owes you this training, today can be the session that satisfies it. And practically: this kit is priced so one purchase order covers a whole staff, at half price for every license after the first. That's not your problem to solve today, but it's why a session like this one exists in your building at all.

SLIDE 4 The gap this hour closes
0:03

MS. RIVERA'S SCREEN · SO FAR Her honest gap: no formal guidance yet, same as most of the room.

And here's the honest starting line: in a 2026 Gallup survey, 82 percent of teachers say they've gotten no formal guidance on using AI in their work. A separate 2026 survey found only 20 percent report extensive training, and 42 percent name a lack of training as their single biggest barrier. If that's you, you are the majority, not behind. Today: the one rule, what "vibe coding" actually means, a live demo of the loop that makes this safe, one change together, and then thirty protected minutes where you build your own.

Segment 2 · The rule, the term, and the loop (slides 5-8)
SLIDE 5 The one hard rule
0:04

MS. RIVERA'S SCREEN · SO FAR Her one rule, before anything opens: no student data in any prompt, ever.

Before a single laptop opens, the rule from Kit 1, restated because today is hands-on and hands-on is where rules get forgotten: no student's name, score, grade, IEP status, behavior record, or writing sample ever enters a prompt. Not today, not with your own class, not as an example. Here's the good news: everything you build today is questions, answers, and a title. There is nowhere for a child's data to even go.

SLIDE 6 What "vibe coding" actually means
0:05

MS. RIVERA'S SCREEN · SO FAR Her definition: describe what you want, in English, and test what comes back.

You've probably heard the term and maybe rolled your eyes a little. Here's what it actually means, no hype: you describe what you want, in plain English. The AI writes the code. You test what it made, and you keep describing changes until it does what you need. No programming class, no syntax to memorize. You already know how to describe what you want clearly, we worked on exactly that skill in Kit 2. That's the whole thing.

SLIDE 7 What it is not

0:06

MS. RIVERA'S SCREEN · SO FAR Her correction: still her content, her questions, her class. The AI types.

Three honest corrections before we go further. It's not magic: every good result traces back to a clear, specific description, vague in still means broken out. It's not hands-off: you read every change, test every change, and decide what ships. And it's not "from scratch": today you change a working program by describing what you want. That's the real skill, and claiming otherwise would be a lie your students catch in a minute. We say what really happened, every time, in every product we make.

SLIDE 8 The loop, named

0:07

MS. RIVERA'S SCREEN · SO FAR Her loop, named: describe, build, test, change one thing.

Four words that are the entire session: describe, build, test, change one thing. Describe what you want, specifically. It builds. You test it yourself, before anyone else does. You change one thing at a time and test again. That loop is what you're about to watch, then practice together, then run on your own for thirty minutes.

Segment 3 · Watch the loop, live (slides 9-13)

SLIDE 9 Ms. Rivera builds one game, start to finish

0:08

MS. RIVERA'S SCREEN · SO FAR Her pick for today: a multiplication-facts review game, her own 4th graders.

Before you try this yourself, watch it happen once, live, on Ms. Rivera's screen. She's building a multiplication-facts review game for her own 4th graders, one artifact, the whole loop, start to finish. Nothing she does here is faster than what you'll do; watch the moves, not the speed.

SLIDE 10 Describe what you want

0:09

→ Her full chat window is the slide, so the tracker chip steps aside here.

Her first instinct was "make me a review game," which is too vague to act on. What she actually typed: she has a starter file, and she describes exactly what to replace, her eight questions pasted in full, a new title, and one more sentence that matters more than it looks: keep everything else in the file exactly the way it works now. That boundary line is the single most useful sentence in this whole session. It's what stops the AI from touching things you never asked it to touch.

SLIDE 11 Build: it writes, she watches

0:10

→ Her chat window again, no tracker chip.

Here's what comes back: the file, updated, her eight questions loaded and her new title on the opening screen. Name what just happened plainly: the tool changed one part of the file. It did not invent a new program, and it did not touch the parts she told it to leave alone. That's the entire "build" step, every time.

SLIDE 12 **Test: she plays it herself, first**

0:11

MS. RIVERA'S SCREEN · SO FAR Her honest limit: it renamed a button she never asked it to touch.

She double-clicks the file. No install, no account, no wifi required. She answers a question wrong on purpose to check the feedback, and it works exactly right: the correct answer holds on screen and explains why. Then she finds an actual bug, a typo in one of her own answer choices. This is normal. This is what testing is for, and it's why the rule is: you play it before anyone else does. Every single time.

SLIDE 13 **Change one thing, then test again**

0:12

→ *Her chat window one more time. This closes the loop; take it slowly.*

Her fix: one sentence, naming exactly which answer choice and exactly what's wrong with it, nothing else. She runs it, plays the whole game again start to finish, and only then calls it done. Describe, build, test, change one thing, and you're back at test. That loop is the entire skill you're about to practice.

Segment 4 · Honest limits, live (slides 14-17)

SLIDE 14 **What it gets wrong, honestly**

0:14

MS. RIVERA'S SCREEN · SO FAR Her honest limit: it renamed a button she never asked it to touch.

Before you try this yourselves, the honest limits. It can rename or move something you never asked it to touch. It can "fix" the wrong line if your request was ambiguous. And here's the one that matters most: it cannot tell when it has misunderstood you. It will sound just as confident either way. None of that is a reason not to build. It's the reason you always test before you trust, which you just watched Ms. Rivera do.

SLIDE 15 **A vague ask gets a vague fix**

0:15

→ *Do this live, on the projector, right now, from your own account. Type exactly "make my game better" into your AI tool and let the room watch what comes back. This is scripted because it is the single most valuable ninety seconds in the session.*

Watch what happens when I ask for something real but vague. I'm going to type "make my game better" and we'll see what comes back.

→ *Let it respond. It will typically make a generic, harmless change to something that wasn't broken, plus a list of unsolicited suggestions. Read what it did out loud, then name what was missing, the way you'd coach a colleague.*

Notice what happened: nothing is broken, but nothing useful happened either, because "better" isn't an instruction. Compare that to the fix we just watched: one sentence, one target, one test. That's the whole difference. A vague result isn't the tool failing, it's a teaching moment, and I wanted you to see it happen before you're the one typing.

If the live demo produces something odd rather than merely unhelpful: stay calm and name it out loud exactly like any other result: "Interesting, that's not what I expected either. This is exactly why we always test before we trust, and why you'll save a copy before your own risky changes in a few minutes." Undo or close without saving, and move to the next slide. An odd result here is not a failed demo; it's the same lesson, one slide early.

SLIDE 16 Save a copy before you prompt
0:16

MS. RIVERA'S SCREEN · SO FAR Her habit now: save a copy before every prompt. Thirty seconds, no exceptions.

One habit that makes every mistake reversible: before any change you're not sure about, save a second copy of the file first. Thirty seconds, no exceptions. The single most likely real problem in today's lab is a change that rewrites more of the file than you expected and loses your questions. A saved copy turns that from a disaster into a thirty-second reset. Teach yourself this as a step, not a tip, starting with your very first change today.

SLIDE 17 No child's data. Ever.
0:17

MS. RIVERA'S SCREEN · SO FAR Her rule slide, same as Kit 1: no child's name, score, or record in any prompt.

Last word before hands go on keyboards. No child's data, ever, not a name, a score, a grade, an IEP note, a behavior record, or a writing sample, not in your prompts today and not in your classroom tomorrow, including yours. This game holds questions, answers, and a title. There's nowhere for a child's data to go, and that's by design, not an accident.

Segment 5 · Guided practice, together (slides 18-20)

SLIDE 18 Everyone makes the same move
0:18

MS. RIVERA'S SCREEN · SO FAR Her hand up first: one change, together, before anyone works alone.

→ *Devices out, starter file open, six minutes. This is the last checkpoint before independent work; do not skip it even if the room is eager to move ahead.*

Open your starter file, everyone, right now. We're going to make one small change together, on the board, projected, so I can catch anyone who's stuck before we split up into independent work.

SLIDE 19 Change the destination name
0:20

→ *Her full prompt is the slide, no tracker chip. Read it word for word, then give the room three minutes and circulate.*

Type this into your AI tool, exactly as written, with your own school mascot or a place from your own subject in the brackets: "Change the DESTINATION at the top of the file from 'Fort Verity' to [your choice]. Change nothing else." This is small and low-risk on purpose. The point is proving the loop works on your machine, not making a meaningful game yet.

SLIDE 20 **Raise a hand if it worked**

0:23

MS. RIVERA'S SCREEN · SO FAR Her checkpoint: did the room's one change actually show up? Confirmed.

Open your file. Does the new name show up on the title screen? If yes, you have the whole loop, and everything in the lab is this, repeated on real content. If no, hands up; help is coming to you.

→ *Do not advance to the lab slide until every raised hand has been resolved. A facilitator cannot debug forty screens at once once the lab opens; this is the moment to catch anyone stuck.*

Segment 6 · The lab: build your game (slides 21-28)

SLIDE 21 **The lab: build your game**

0:24

MS. RIVERA'S SCREEN · SO FAR Her lab, same as yours: the starter file, her questions, two real changes.

→ *This slide and the six that follow it stay up as reference for the whole 30-minute lab; you do not need to advance every minute. Circulate constantly.*

Thirty protected minutes, starting now. Most of you: Track 1, open the starter file, press **Put my own questions in** on the opening screen, fill in the form with your own questions, then make two real changes by describing them, one cosmetic, one behavioral. A few of you already know you want to start from nothing: that's Track 2, and it's a completely normal path, not a harder one, raise a hand and I'll get you the first prompt. One rule for everyone: no student information, ever, and save a copy before any change you're unsure about.

SLIDE 22 **Your three moves**

0:25

MS. RIVERA'S SCREEN · SO FAR Her Track 1: open the file, press Put my own questions in, fill in the form.

Three moves, on screen the whole time you're working: open the starter file, press **Put my own questions in** on the opening screen and type your eight to ten questions into the form, then make your two changes by describing them, testing after each one. Last, press **Save my game as a file** and walk out with it. Nobody edits code to enter questions or to save the game.

SLIDE 23 **The setup screen, up close**

0:26

MS. RIVERA'S SCREEN · SO FAR Her setup screen: three ways to fill it, and the one that drafts a round for her.

→ *This is the best ninety seconds of the lab. Do it live on the projector. Open your own copy of the starter file, press **Put my own questions in**, type a topic into the What this round reviews box (use a subject, never a student), press **Copy the prompt**, and paste it into your AI tool. Let the room watch it answer.*

Here is what the setup screen does. Press "Put my own questions in" on the opening screen and you get one page. Three ways to fill it. One: type your questions straight into the form, one card each. Two: paste a list, one question per line, and the page loads it and tells you any line it had to skip and why. Three, the fast one: type your topic into the top box and press "Copy the prompt." That prompt asks any AI tool for a whole round in the exact shape this page wants. Watch.

→ *Paste the prompt into the AI tool. When the twelve lines come back, paste them into the box labeled Paste what the AI gave you here and press **Load these questions**. Then read the result out loud against what a teacher would actually want.*

Twelve questions, in moments. That is fast. Fast is not the same as right, so now I read them the way you will. Look at this one [point at a real question from your round and say what is off: a wrong answer that is too easy to rule out, a fact that differs from what you teach, a "why" line that does not teach]. The AI drafted, I decide. Every one of you reads every question before anyone plays it, and fixes the ones that are off, right in the form.

→ *Find something real to point at. Almost every round has at least one question that is too easy, too tricky, or slightly wrong on a fact. Name it specifically. If, by chance, the round is flawless, say so and read one "why" line aloud to check it teaches on its own; that is the other place these drafts fall short. Either way you have just shown the room the habit the whole session is built on.*

If asked "what's the idea field for?" That's what lets the game bring a question you missed back later instead of just moving on. It's two or three words, like "fractions" or "capitals," and every question on the same concept should use the same words. The game works best with three or four ideas in a round.

If the AI's answer will not load: the page names every line it skipped and why (usually a stray heading, a number at the start of a line, or a missing part). Say: "That is the page telling us exactly what to ask for." Paste the message back into the AI and say "fix this," or delete the odd lines and load again. A skipped line in front of the room is a teaching gift, not a failed demo.

SLIDE 24 One cosmetic. One behavioral.

0:27

MS. RIVERA'S SCREEN · SO FAR Her two prompts: one cosmetic, one behavioral, both hers to choose.

Two starting templates for your required changes, more on the handout. Notice both end the same way: "keep everything else the same." That boundary line is doing real work. Test after each change, not after both, same as the loop, one at a time.

SLIDE 25 Three minutes: write four questions now

0:28

MS. RIVERA'S SCREEN · SO FAR Her three minutes: four questions, roughed out, good enough to start.

→ *Call this out by name at lab start, not as a footnote. Expect roughly a third of the room to arrive without their questions written, per the prep guide's ask.*

If you didn't bring questions, that is completely normal, take three minutes right now. Pick one thing your students need to know cold this unit, and write four questions on it, rough is fine, you'll refine them while the game runs. Or skip the writing: type your topic into the setup screen and let the prompt there draft a round for you, then read every question. And if that isn't enough: the starter file already ships with a working sample game. Nobody is stuck.

SLIDE 26 For the few who want to build from zero

0:29

MS. RIVERA'S SCREEN · SO FAR Her Track 2 path: the one she didn't need, but some in her building will.

For Track 2: this is the full first prompt from your handout, ready to paste into any AI coding tool. Notice it asks for the same design rules baked in from the start, no logins, works offline, brings missed questions back, never a public leaderboard. I won't hover here; ask for help when you want it, not before.

SLIDE 27 "It gave me a blank page."

During the lab

MS. RIVERA'S SCREEN · SO FAR Her fix for a blank page: read the error out loud to the AI, try again.

→ *Leave this up as a reference; say the recovery line out loud the first time it happens in the room, then let the next person self-serve from the slide.*

If your screen goes blank: that's almost always a small typo in the code the AI just wrote. Copy the exact error message from your browser, or just say "it's a blank page, nothing shows up," and paste that back to the AI. Say "fix this." It almost always can, and it's usually a quick fix.

SLIDE 28 "It changed the wrong thing." / "My questions disappeared."

During the lab

MS. RIVERA'S SCREEN · SO FAR Her fix for a wrong change: undo, narrow the ask, try again.

If it rewrote more than you asked for, this is the single most likely real problem today, and it's exactly why we saved a copy first. Close the file without saving, reopen your saved copy, and try again with a narrower request, for example "change only the title text, nothing else in the file." If you didn't save a copy, press **Put my own questions in** and type or paste your questions back in rather than starting over. Either way: stay calm, this is never unrecoverable, and a live recovery in front of the room is more reassuring than a clean run would have been.

Segment 7 · What you built, and commitments (slides 29-32)

SLIDE 29 What you actually built, honestly

0:54

MS. RIVERA'S SCREEN · SO FAR Her honest tally: she changed a working program. She did not write one.

Say this plainly, don't let the room infer it: you changed a working program by describing what you wanted, tested every change yourself, and ended with your own questions in a game your students can play with the wifi off. You did not write this from a blank file, and this kit never claimed you would. What you own now is the loop, and that loop works on the next tool you build too.

SLIDE 30 Where this pattern goes next

0:55

MS. RIVERA'S SCREEN · SO FAR Her transfer: the pattern moves to spreadsheets, forms, anything next.

This same loop builds a seating chart, a sign-out log, a reading tracker, any small tool your room needs. Our full build-along sessions in the store teach this pattern on a new classroom tool each time, start to finish, if your staff wants to go further.

SLIDE 31 Show us what you made

0:56

MS. RIVERA'S SCREEN · SO FAR Her share-out: three screens up, her game one of them.

→ *Two to three volunteers, a minute each, projected from their own laptop if the room allows it.*

Who wants their game on the big screen? Tell us your one behavioral change and what it did. And I'll ask directly: did anyone hit the blank-page fix or the wrong-change fix for real? Tell us, that story is worth more than a clean run.

SLIDE 32 Commitment #4

0:58

MS. RIVERA'S SCREEN · SO FAR Her commitment, said out loud: one game, live with her class, by Friday.

Kits 1 and 2 gave us three commitments. Today adds a fourth: this game gets played with real students by Friday, not filed away. Can I get a nod on that?

Segment 8 · First 48 hours & close (slides 33-34)

SLIDE 33 First 48 hours, then the exit ticket

0:59

MS. RIVERA'S SCREEN · SO FAR Her first 48 hours: play it with students, fix the first real bug live.

→ *Distribute exit tickets; collect at the door. They double as this hour's PD documentation.*

Three small things in the next two days: play your game with one real class, or a colleague standing in if timing doesn't line up. Fix the first real bug that shows up, using the recovery lines from today, there will be one, that's normal. And two minutes on the exit ticket: one technique you're taking, one thing you'll try.

SLIDE 34 Close

1:00

Last word. You just described software into existence. That is not a small thing, and it is not a trick, it is a skill you already had most of: knowing exactly what you want and saying so clearly. Keep that skill pointed at the next thing your room needs. Thanks, everyone.
