

VIBE CODE YOUR OWN GAME

THE LONG ROAD

A review game for **any subject and any grade**. Open the file, put your own questions in, and play it the same day. Your class picks the road at every fork — the easy one, the steady one, or the hard pass that pays — and whatever they get wrong blocks the road later until somebody comes back and fixes it.

10

minutes from opening this to
playing your own version

1

file, no installing, no accounts,
works offline

0

ways for a student to lose in
front of the class

Your questions go in without touching any code.

There is a setup screen built into the game. Type them in, or paste a list, or use the prompt on page 5 to have AI draft a set in about thirty seconds and then read them over. Press **Save my game as a file** and you have your own copy to keep, reuse and hand to the teacher next door.

Why the wrong answers are the point

Competence is the strongest driver of student motivation, and points do not produce it. So the loudest moment in this game is not a high score. It is the moment a student goes back to something they got wrong, gets it right, and watches the road open.

What is in this pack

The finished game · ten minutes to make it yours · how to write questions worth answering · five ways to run it in class, with timings · four copy-and-paste prompts that change the game itself · the fixes for what actually goes wrong · and where your things live.

Ten minutes, start to finish

Do these in order. You are playing your own version by the end of step four.

1

Unzip the folder and double-click `long-road.html`

It opens in whatever browser you already use. Nothing installs, nothing asks you to sign in. The sample round is about the water cycle, so play a fork or two to see the shape of it before you change anything.

2

Press Put my own questions in

It is on the opening screen, under the Set out button. That is the setup screen, and it is the only place you ever need to go.

3

Fill in the title, the destination, and what you are reviewing

The destination is where the class is traveling to. Name it something from your unit and the whole round reads as though it was written for that unit, because it was. **Sixth grade fractions** and **Halfway Camp** take nine seconds and do a lot of work.

4

Get your questions in, by whichever of these suits you

Have AI draft them. Copy the prompt the screen gives you, paste it into whichever AI tool you use, paste the answer back into the box, press Load. About thirty seconds. **Read them before you play them** — AI gets things wrong, and you are the one who knows your standards. **Or type them in** on the same screen, one card per question. **Or paste a list you already have**, one question per line.

5

Press Save my game as a file

This is the step people skip and regret. It hands you back a single file with your questions already inside it. Put it wherever you keep your own work. It opens on any computer, it survives clearing your browsing data, and you can email it to a colleague who can then change it for their own class.

Keep the original. Save each round as its own file — `fractions.html`, `cell-parts.html`, `chapter-7.html` — and leave `long-road.html` as it came. Then a round you want back next year is still there, and you always have a clean copy to start from.

Questions worth answering

The game is the same whatever you put in it. **The questions are the lesson**, and four small decisions on the setup screen are what separate a round students ask to replay from a quiz with scenery.

On the screen	What it is for	Getting it right
The question	What you are asking	One idea per question. If a student needs two things to answer it, a miss does not tell you which one they are missing.
Idea it tests	The game tracks mastery by idea , never asks two of the same idea in a row, and brings a missed idea back later	Three or four ideas in a round, several questions each. This is the setting most people get wrong. Twelve different ideas gives the game nothing to work with.
Level	Students choose their own difficulty by choosing the road, so every level needs questions waiting	Roughly a third each. Level 1 is recall, level 2 is applying it, level 3 is reasoning about something they have not seen before.
Why the answer is right	The one line held on screen after a wrong answer	Write this one properly. It is the only teaching the game does. A student who got it wrong should be able to learn from this sentence alone, with nobody explaining it.

What a good "why" line sounds like

Weak: "Evaporation is the correct answer." That tells a student who was wrong absolutely nothing.

Strong: "The water did not go anywhere solid or liquid. Heat turned it into vapor." Now the miss was worth something.

Twelve to twenty questions is a round

Fewer than six and the game runs out of things to ask. More than about twenty and a single round stops being a review and starts being a test, which is not what anybody is here for. You can make as many rounds as you like; each is its own saved file.

Wrong answers do real work here. Make the wrong three plausible. The three students most often confuse with the right one will teach you more, in the room, than any number they could score.

Five ways to run it

Same file every time. Only who holds the mouse changes.

1 • Whole class, projected – 15 to 20 minutes

The road comes up, the class argues about which one to take, you click. Answers by hands, by whiteboards, or by calling on somebody. **The arguing at the fork is where the learning is**, so do not rush it. Best first outing, because nobody is on the spot alone.

2 • Pairs on one device – 20 minutes

Two students, one screen, and a rule that they have to agree before clicking. That rule is the whole activity. You are free to walk and listen, which is the best data you will get all week.

3 • A station – runs itself

Leave it open on the one computer in the corner. There is no timer, no login and no way to lose, so a student arriving mid-round can simply play. Put the file on a flash drive and it works on a machine with no internet at all.

4 • The five minutes before the bell

One fork, one question, out. Because the game remembers nothing between openings except the class best, there is no cost to stopping anywhere.

5 • Students write the questions – a whole lesson

Hand groups the four parts from page 3 and make them write questions for the round, **including the why line**. Writing a good wrong answer is harder than answering one, and it shows you who actually understands the unit. Then play the class's own round. This is usually the day people tell you about afterwards.

Two things not to do. Do not put a student's name on the screen — there is nowhere to type one and that is deliberate. And do not tie it to a grade. The moment a score counts, the fun stops doing the work and the game becomes a test with hills in it.

Four prompts that change the game itself

Everything so far needed no code. This page is the other half: **the game is one file you own, so you can change how it works**, not just what it asks. Open `long-road.html` in any AI assistant that accepts a file, paste one of these, and ask for the whole file back. Save the result as a **new** file and keep the old one.

1 · CHANGE THE WORLD IT HAPPENS IN

Here is a working HTML game. Change the setting from a road across open country to **a voyage between islands**. Keep every rule exactly as it is: the choice at each fork, the question that resolves it, the blocked crossings, the celebration when one is cleared. Change only the words, the colors and the shapes that are drawn. Give me the whole file back.

2 · MAKE A ROUND SHORTER OR LONGER

In this file, change the length of a journey so it takes about **eight** forks instead of the current number, and tell me which line you changed and what the number means, so I can change it myself next time.

3 · ADD SOMETHING THE CLASS CHOOSES TOGETHER

Add one more piece of gear a player can pick at a camp: **a spyglass that shows which idea the next fork will ask about**. Follow exactly how the existing gear is written. Do not change anything else.

4 · MAKE IT EASIER TO READ AT THE BACK OF THE ROOM

Increase every font size in this game by about a quarter and raise the contrast of the answer buttons, keeping the layout intact so nothing overflows on a projector at 1280 by 720. Give me the whole file back.

Three rules that will save you an afternoon. Change **one** thing per prompt, and play it before you ask for the next one. Always say *give me the whole file back*, or you will get a fragment and no way to place it. And always save under a new name — then a result you dislike costs you nothing at all.

The things that actually break

In order of how often they happen.

What you see	What to do
"Not ready to play yet", with a list	Nothing is broken. The game will not start on questions it cannot use, and the list names every one. The usual causes are an empty fourth answer and a missing why line.
Pasted questions did not load	Every line needs eight parts separated by the character. If the AI numbered the lines or added a sentence of its own, delete those lines and press Load again. The message tells you which line numbers it skipped and why.
Your questions disappeared	They were kept in the browser and the browsing data was cleared, or you opened the file on a different computer. This is exactly what Save my game as a file prevents, and why page 2 puts it in step five.
The same idea keeps coming up	Most of your questions are tagged with one idea. Give the round three or four, several questions each.
A fork offers only easy roads	There are no level 2 or level 3 questions left unused. Add a few harder ones.
It will not open at all	Right-click the file, choose Open with, and pick a browser. A school laptop sometimes tries to open an HTML file in a text editor.
An AI change broke the game	Delete that file and open the copy you kept. This is the whole reason page 5 says to save under a new name.

If the AI hands you back a file that will not run

Give it back the error and one sentence: *this stopped working after your change, here is what the browser says, fix only that*. Do not start again from the beginning — the second attempt almost always lands.

What it does not do, and where your things live

Blooket, Gimkit and Kahoot exist, and they are good

They start faster and look slicker, and a class already knows them. This is a different trade, and it is worth being plain about it: **no logins for anybody, works with the wifi down, cannot be blocked or switched off, nothing to renew, and every rule in it is yours to change.** There are also AI tools that will generate a classroom game from a sentence. Those are games on somebody else's platform, behind somebody else's account. This is a file on your drive. Pick whichever suits the day.

Where your things live, in three lines

Your questions. On this page while you type them, in your browser if you press Keep, and in your own file when you press Save. They are yours, they are not about any student, and they are transmitted nowhere.

The class best. Days and ideas only, kept in that one browser on that one computer. No names, because there is nowhere to put one.

Anything you paste into an AI tool. That leaves the room, and it goes to a company. Questions about the water cycle are fine. **A student's name, work, score, or anything about their needs is not** — that is the line, it does not move, and it applies to every AI tool your building uses.

The most-asked feature, refused on purpose. There is no leaderboard with student names, and there will not be one. It would put children's names and performance into a file that gets emailed around, and ranking students publicly does the most damage to the ones already struggling. The score the game keeps is **ideas locked in**, it only ever goes up, and the biggest moment in the whole game belongs to the student who was wrong and is now right.

What this pack is not

It is not a course in programming, and it does not teach you to build a game from nothing. It hands you a working one, shows you how to fill it with your own content in ten minutes, and shows you how to change it by asking. That is the whole promise, and it is the whole of what is in the box.

License, credit, and one favor

What you may do

Use it with your own students for as long as you teach. Change it however you like. Save as many versions as you want. Put it on the classroom computers, on a flash drive, on a laptop cart. Your one purchase covers you and your classes.

What needs another license

Sharing it with other teachers, putting it on a shared drive or server, or handing it round a department or a building. Additional licenses are half price on the listing, and a school can buy them on a single purchase order. Please do not post the file publicly or sell anything made from it.

A note on the shape of the game

Journeys, forks and supplies are old ideas that belong to nobody, and you are welcome to build on them. The words, the art and the code in this file are ours. That distinction is worth knowing if you start changing games with AI: **how a game works is free to borrow, and the way a particular game says and draws it is not.** Build on the idea, write your own words.

If this earned its keep, would you leave a review? TPT gives you credits toward your next purchase for it, and it is the only thing that decides whether another teacher ever sees this. If something did not work, tell us that instead and we will fix it.

Built and audited by two certified teachers

Written by classroom teachers, used with real classes, and checked by a second teacher before it shipped. The game was played start to finish, on a teacher's own set of questions, before this pack was published.
