

FLIP THROUGH BEFORE YOU DOWNLOAD

Build a Self-Checking Practice Activity

Three real pages, straight off the shipping files, plus everything the full download includes.

WHAT YOU WILL HAVE AT THE END

Before any instruction, here is the thing you are building, so you know whether it is worth your evening.

A student opens one file and sees:

What they do	What happens
Read a question	Plain text, as many questions as you want — five or fifty.
Click an answer	Wrong: the choice grays out, and the activity says try again. Nothing is lost.
Click again	Right: the choice turns green and a sentence explains why it is right.
Keep going	A counter tracks how many times you go on the first try — not how many guesses the student makes.
Finish	A summary panel, and a button to run the whole set again.

SNEAK PEEK · 29 pages + 1 working file

What it does not do, on purpose

It does not ask for a name. It does not ask for a login. It does not send anything anywhere. It does not keep a record after the browser tab closes. Every one of those is a deliberate choice, and page 4 explains why it matters more than it sounds.

Why build it rather than buy it?

Because the question bank is yours. The vocabulary list you actually taught, the misconceptions your class actually has, the four problems that came up on Tuesday. No purchased activity knows those.

Ask for the first version

Open your AI chat and paste this. It is long on purpose — every sentence in it exists because leaving it out produces something worse.

PROMPT 1 • THE FIRST BUILD

Build me a self-checking practice activity as one single HTML file I can save and open in a browser.

How it should work for a student:

- They see a list of questions, each with four answer choices as clickable buttons.
- If they click a wrong answer, that choice is grayed out and disabled, a message tells them to try again, and they can still pick another answer.
- If they click the right answer, it turns green, the other choices lock, and a sentence explains why that answer is correct.
- A counter at the top shows how many they got right *on the first try* — a wrong guess first should not count as a first-try correct.
- When every question is answered, show a summary and a button to start over.

Requirements:

- Everything in ONE file. No links to outside files, no internet needed, no login.
- Put my questions in a clearly marked list at the very top so I can edit them without touching anything else.
- Add comments above the questions showing how to add or remove a question.
- Nothing is saved, there and no student name is ever asked for.
- Big buttons — this may be used on a tablet.

Use five questions about rounding to the nearest ten as the example content so I can see it working.

Why "one single HTML file" matters. It is the difference between a thing you own and a thing you rent. One file goes on a shared drive, into your LMS, onto a flash drive, or into an email. Nothing expires and nothing needs an account.

Two more, and a rule

5. It asks for a name or a login

Cause: the AI added a feature you did not ask for — it does this sometimes, trying to be helpful. **Fix:** "Remove the name field and any login. This must not collect anything about the student." Say it plainly; it will comply. And notice that this is the Tier 1 rule from page 4 doing its job.

6. It worked, then you changed something, and now it does not

Cause: a missing quote mark or comma in the question list. **Fix:** compare your edit to the pattern on page 10. Every question needs its quote marks closed and a comma between entries. If you cannot spot it, paste the question list into the chat and say "something in this list is broken — find it."

The rule that covers everything not on this list:

Describe what you saw, in ordinary words, and ask for it to be fixed. You do not need to use fancy vocabulary. "The green thing does not appear when I get it right" is a completely perfect bug report and it will be understood.

When to stop fixing and start over

If three tries have not fixed it, the conversation has probably tied itself in a knot. Start a fresh chat, paste Prompt 1 again, and add the one thing that went wrong. This is faster than untangling, and it costs you two minutes.

WHAT IS INSIDE

Build a Self-Checking Practice Activity

- ✓ **Nine prompts** — written out in full, copy and paste
- ✓ A **working activity file**, included and ready to use
- ✓ Six real failures and the sentence that fixes each
- ✓ The three-tier rule for handling student data
- ✓ A planning page to fill in before you build
- ✓ Works in any browser, offline, with no login

Running it with your whole staff? Additional teacher licenses are just \$9.5, and we accept purchase orders through TpT for Schools.
